SimpleGrid 3×3, 2 observed actions

2 possible goals per problem; 4 problems; pinned evidence

Method	Runs	CNF variables	CNF clauses	Mean time (s)	Max time (s)	True goal among top scorers	True goal is the sole top scorer	Mean P(true goal)
max-term	8	141	820	12.1	13.2	8/8	0/8	0.500
sharpsat-td	8	141	820	16.0	16.7	4/8	4/8	0.500
mc-sat	8	141	820	14.2	15.7	4/8	4/8	0.570
addmc	8	141	820	9.0	9.7	4/8	4/8	0.500

Each run is one problem, one pinned evidence file (the first N drives of a plan) and one recognize.sh `--counter` method. CNF size is the instantiated problem plus evidence that every method starts from (max-term adds its own soft clauses); it depends on the problem and evidence, not the method. Times are wall-clock, 8 runs in parallel (ADDMC: 2), each limited to 1 minute; every run finished. "Top scorers" are the hypotheses sharing the highest posterior, so a tie counts as among them but not as sole.
