SimpleGrid 5×5, 1 observed action

4 possible goals per problem; 4 problems; pinned evidence

Method	Runs	CNF variables	CNF clauses	Mean time (s)	Max time (s)	True goal among top scorers	True goal is the sole top scorer	Mean P(true goal)
max-term	16	760–865	5,249–5,995	25.6	36.8	16/16	0/16	0.250
sharpsat-td	16	760–865	5,249–5,995	35.0	103.5	6/16	2/16	0.250
mc-sat	16	760–865	5,249–5,995	219.4	333.6	6/16	6/16	0.243

Each run is one problem, one pinned evidence file (the first N drives of a plan) and one recognize.sh `--counter` method. CNF size is the instantiated problem plus evidence that every method starts from (max-term adds its own soft clauses); it depends on the problem and evidence, not the method. Times are wall-clock, 8 runs in parallel, each first limited to 1 minute and rerun with 15 minutes if it timed out (its time is then that of the rerun); every run finished. "Top scorers" are the hypotheses sharing the highest posterior, so a tie counts as among them but not as sole.
