SimpleGrid 6×6, 1 observed action

5 possible goals per problem; 4 problems; pinned evidence

Method	Runs	CNF variables	CNF clauses	Mean time (s)	Max time (s)	True goal among top scorers	True goal is the sole top scorer	Mean P(true goal)
max-term	20	1,440–1,596	10,334–11,478	31.2	70.1	20/20	0/20	0.200
sharpsat-td	20	1,440–1,596	10,334–11,478	37.7	41.7	4/20	4/20	0.200
mc-sat	20	1,440–1,596	10,334–11,478	350.0	398.6	4/20	4/20	0.182

Each run is one problem, one pinned evidence file (the first N drives of a plan) and one recognize.sh `--counter` method. CNF size is the instantiated problem plus evidence that every method starts from (max-term adds its own soft clauses); it depends on the problem and evidence, not the method. Times are wall-clock, 8 runs in parallel, each limited to 15 minutes; every run finished. "Top scorers" are the hypotheses sharing the highest posterior, so a tie counts as among them but not as sole.
