SimpleGrid 4×4, 2 observed actions

3 possible goals per problem; 4 problems; pinned evidence

Method	Runs	CNF variables	CNF clauses	Mean time (s)	Max time (s)	True goal among top scorers	True goal is the sole top scorer	Mean P(true goal)
max-term	12	400	2,611	16.2	16.7	12/12	0/12	0.333
sharpsat-td	12	400	2,611	20.1	20.4	8/12	4/12	0.381
mc-sat	12	400	2,611	32.9	33.9	4/12	4/12	0.352

Each run is one problem, one pinned evidence file (the first N drives of a plan) and one recognize.sh `--counter` method. CNF size is the instantiated problem plus evidence that every method starts from (max-term adds its own soft clauses); it depends on the problem and evidence, not the method. Times are wall-clock, 8 runs in parallel, each first limited to 1 minute and rerun with 15 minutes if it timed out (its time is then that of the rerun); every run finished. "Top scorers" are the hypotheses sharing the highest posterior, so a tie counts as among them but not as sole.
