SimpleGrid 4×4, all evidence lengths

3 possible goals per problem; 4 problems; pinned evidence

Method	Runs	CNF variables	CNF clauses	Mean time (s)	Max time (s)	True goal among top scorers	True goal is the sole top scorer	Mean P(true goal)
max-term	36	400	2,610–2,612	16.0	17.7	36/36	0/36	0.333
sharpsat-td	36	400	2,610–2,612	20.0	20.8	20/36	8/36	0.368
mc-sat	36	400	2,610–2,612	32.9	34.0	15/36	15/36	0.364

Each run is one problem, one pinned evidence file (the first N drives of a plan) and one recognize.sh `--counter` method. CNF size is the instantiated problem plus evidence that every method starts from (max-term adds its own soft clauses); it depends on the problem and evidence, not the method. Times are wall-clock, 8 runs in parallel, each first limited to 1 minute and rerun with 15 minutes if it timed out (its time is then that of the rerun); every run finished. "Top scorers" are the hypotheses sharing the highest posterior, so a tie counts as among them but not as sole.
