SimpleGrid 5×5, all evidence lengths

4 possible goals per problem; 4 problems; pinned evidence

Method	Runs	CNF variables	CNF clauses	Mean time (s)	Max time (s)	True goal among top scorers	True goal is the sole top scorer	Mean P(true goal)
max-term	64	760–865	5,249–5,998	35.0	118.9	64/64	0/64	0.258
sharpsat-td	64	760–865	5,249–5,998	35.1	103.5	24/64	14/64	0.271
mc-sat	64	760–865	5,249–5,998	210.1	333.6	16/64	16/64	0.252

Each run is one problem, one pinned evidence file (the first N drives of a plan) and one recognize.sh `--counter` method. CNF size is the instantiated problem plus evidence that every method starts from (max-term adds its own soft clauses); it depends on the problem and evidence, not the method. Times are wall-clock, 8 runs in parallel, each first limited to 1 minute and rerun with 15 minutes if it timed out (its time is then that of the rerun); every run finished. "Top scorers" are the hypotheses sharing the highest posterior, so a tie counts as among them but not as sole.
