SimpleGrid 7×7, all evidence lengths

6 possible goals per problem; 4 problems; pinned evidence

Method	Runs	CNF variables	CNF clauses	Mean time (s)	Max time (s)	True goal among top scorers	True goal is the sole top scorer	Mean P(true goal)
max-term	144	2,436	17,937–17,942	40.0	49.8	144/144	0/144	0.181
sharpsat-td	144	2,436	17,937–17,942	105.2	328.9	31/144	31/144	0.200
mc-sat	144	2,436	17,937–17,942	737.3	784.9	28/144	28/144	0.191

Each run is one problem, one pinned evidence file (the first N drives of a plan) and one recognize.sh `--counter` method. CNF size is the instantiated problem plus evidence that every method starts from (max-term adds its own soft clauses); it depends on the problem and evidence, not the method. Times are wall-clock, 8 runs in parallel, each limited to 20 minutes of awake time (sleep not counted); 38 runs did not finish; each counts as a miss in the top-scorer columns and is left out of the times and mean P(true goal). "Top scorers" are the hypotheses sharing the highest posterior, so a tie counts as among them but not as sole. 2 of the unfinished runs ended early with an error instead (no posterior).
